- ✓ Multiple Reporting Functionality
- ✓ Computer/PDA/RFID Reader
ALL IN ONE
- ✓ Hardware & Software Supplied by

INFORMATION TECHNOLOGY SOLUTIONS MOVING YOUR BUSINESS FORWARD

Successful beef marketing is having the flexibility to access both local and export markets when the opportunity arises. The ability to gain premiums by supplying accurate and auditable information, right down to the individual animal, is key to keeping a business competitive.

RFID technology has been adopted by the beef industry to ensure that Canadian beef is a safe, wholesome food product. Compliance with both domestic and international food safety and animal traceability regulations has increased the need to adopt this technology along all segments of the beef production chain.

Data collection systems allow producers to access all available markets as well as improve efficiency, productivity and profitability. RFID technology gives producers the ability to collect, store and access the information with accuracy and ease which benefits the bottom line of any agriculture business.
